Re: CC Docket No. 92-297
Ex Parte Presentation

RECEIVED
JAN 26 1996
FEDERAL COMMUNICATIONS COMMISSION
OFFICE OF SECRETARY

Dear Mr. Caton:

Representatives of Texas Instruments, Inc., met yesterday afternoon with Mr. Thomas Tycz of the Commission's International Bureau, Mr. Donald Gips of the Commission's Office of Plans and Policies, and other members of the FCC staff, as well as other participants from industry, on matters related to the pending proceeding in CC Docket No. 92-297. (An attendance list is attached.) Texas Instruments, Inc., was represented by Gene Robinson, Bob Pettit, and Paul Misener. The attached materials formed the basis of discussions.

An original and two copies of this letter are submitted. A copy of this letter, without attachments, is being sent simultaneously to Messrs. Tycz and Gips.

Respectfully submitted,

No. of Copies rec'd

Band Plan Options for the 28 GHz Band

Option 1: Band plan proposed in the Third NPRM.

LMDS fss	GSO/FSS ngso/fss	NGSO/FSS gso/fss	MSS FEEDER LINKS & LMDS [H→S]	MSS FEEDER LINKS & GSO/FSS	GSO/FSS ngso/fss
850 MHz	250 MHz	500 MHz	150 MHz	250 MHz	500 MHz
27.5	28.35	28.6	29.1	29.25	29.5
30.0 GHz					

- LMDS subscriber transceivers would not be able to transmit in the band shared with feeder links.
- TRW would operate on a reverse band basis. Sharing criteria necessary between feeder links for the 2 MSS systems at 19 GHz.
- First come first served protection in the 29.25-29.5 band segment.

Option 2: More Extensive Sharing Requirements

LMDS fss	GSO/FSS ngso/fss	W R C - 9 7	NGSO/FSS gso/fss	TRW, Motorola, & LMDS [S→H]	TRW, Motorola & GSO/FSS	GSO/FSS ngso/fss
850 MHz	250 MHz		400 MHz	150 MHz	250 MHz	500 MHz
27.5	28.35	28.6 28.7	29.1	29.25	29.5	30.0 GHz

- Rules for sharing between Motorola and LMDS so that LMDS can transmit from subscriber to hubs in the shared portion of the bands. (See Attached).
- Rules for sharing between TRW and Motorola i.e., geographical separation of gateway earth stations at distances to be determined by the FCC between approximately 200 and 800 kilometers.
- Rules for sharing between 2 MSS feeder link systems and GSO systems.

Option 3: Staff Band Segmentation Adjustment

LMDs fss	GSO/FSS ngso/fss	W R C - 9 7	NGSO/FSS gso/fss	Motorola & TRW	TRW & LMDs [S→H]	GSO/FSS ngso/fss
850 MHz	250 MHz		400 MHz	150 MHz	125 MHz	625 MHz

27.5 28.35 28.6 28.7 29.1 29.25 29.375 30.0GHz

- 40 kilometer coordination zone around 2 U.S. TRW sites. In this zone, LMDs accepts interference or undertakes mitigation efforts consistent with TI's proposal for subscriber to hub operations.
- Sharing criteria for Motorola and TRW (Same as Option 2).

Tentative Draft Staff Recommendation

§101. LMDS subscriber transceivers transmitting in the 29.1-29.25 GHz Band

1) LMDS subscriber transceivers operating in the 29.1-29.25 GHz band:

a) shall operate at a peak EIRP per carrier of 12 dBW/MHz in clear air, and shall reduce its EIRP at distances less than the maximum distance from the hub at which a subscriber transceiver is located in accordance with the following formula:

$$\text{EIRP(dBW/MHz)} = 12 \text{ dBW/MHz} + 20 \log d/D$$

where d = transceiver distance to hub

D = maximum transceiver distance to hub

the peak EIRP derived from this formula may be exceeded in cases where link propagation attenuation exceeds the clear air value and only to the extent that the link is impaired plus a 1 dB margin.

b) shall not exceed the relative peak antenna gain described in Figure X .

See Attached Figure X

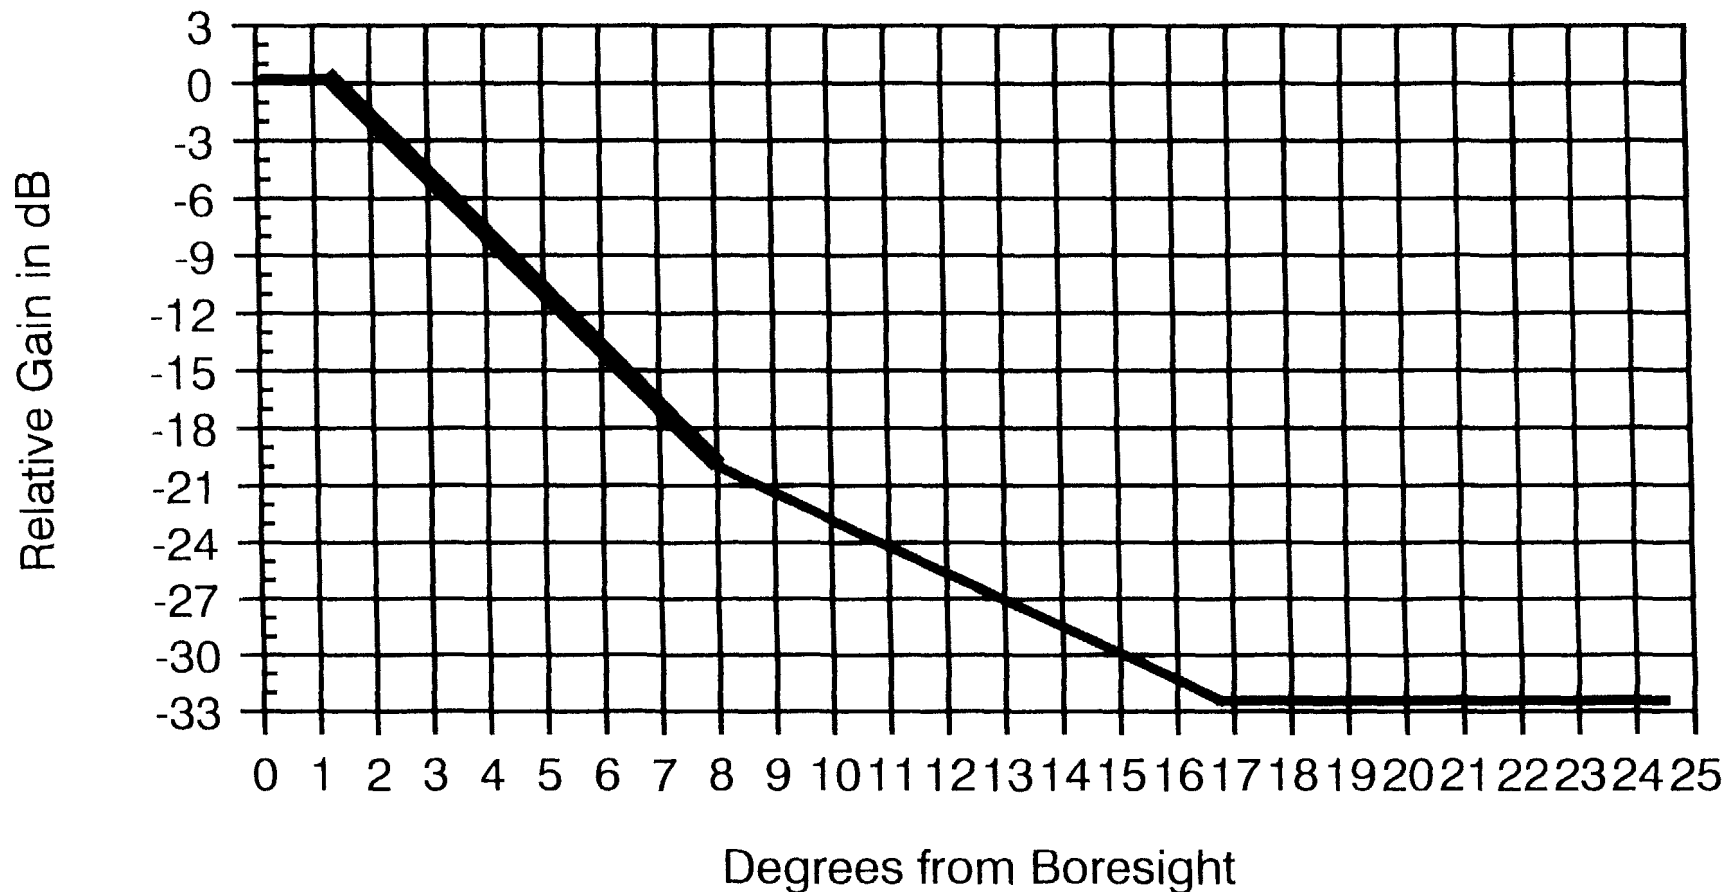

c) each CPE shall automatically inhibit its transmissions if it is not receiving a signalling / communication channel from its associated hub.

LMDS hub stations receiving in the 29.1-29.25 GHz Band:

a) shall be capable of providing automatic power control to LMDS subscriber transceivers to ensure that the EIRP defined in Section X Part (a) is not exceeded by more than 1 dB.

Elevation and Azimuth

Summer 95 28 GHz Band Plan Proposal is Unworkable

HUGHES
COMMUNICATIONS

25 January 96

- **Shares 250 MHz between NGSO MSS feeder links and GSO FSS**
- **Sharing between these two services has been vigorously studied for over a year**
 - **No acceptable alternatives have been developed to date**
 - **All proposed solutions are unacceptable to either one or both of the services**
- **ITU will study for another two years**

**A successful spectrum plan requires frequency
segmentation between NGSO MSS and GSO FSS**

Sharing Methods Considered - No Satisfactory Solution

HUGHES
COMMUNICATIONS

25 January 96

Method	Problem
Path diversity (NGSO MSS feeder links)	<ul style="list-style-type: none">• Requires change to system design
MEO Orbit avoidance	<ul style="list-style-type: none">• Does not solve LEO systems problem• Encumbers 60 % of GSO locations
Exclusion zones	<ul style="list-style-type: none">• Precludes GSO service in prime populated areas
Large antennas for FSS earth terminals	<ul style="list-style-type: none">• Fundamentally inconsistent with consumer demand• Still requires exclusion zones

Advantages of 25 Jan 96 Proposal

25 January 96

- **Compatible with WRC 95 decisions**
- **Includes accommodation for potential growth spectrum (100 MHz each) for NGSO MSS feeder links and NGSO FSS**
- **All proposed services receive their stated band requirements**
- **Co-frequency sharing is assigned to compatible services (e.g., LMDS and NGSO MSS feeder links)**

Enables immediate investment and development of a new class of wireless telecom services for the US market

All Services Compromise

Uplink Interference at Ka-Band from MSS Feeder Links (Odyssey) into GSO FSS Systems

Dr. Richard Barnett

TELECOMM STRATEGIES for Lockheed Martin

January 25, 1996

Interference Analysis

- Uplink only
- Worst case (no mitigating factors)
- Independent of TRW analysis (simulation software)
- Results relevant to small or large user terminals in the GSO FSS system
- Compares interference against CPM criteria
- Discusses outages versus interference
- Includes comparison with sun outage events
- Concludes sharing is feasible

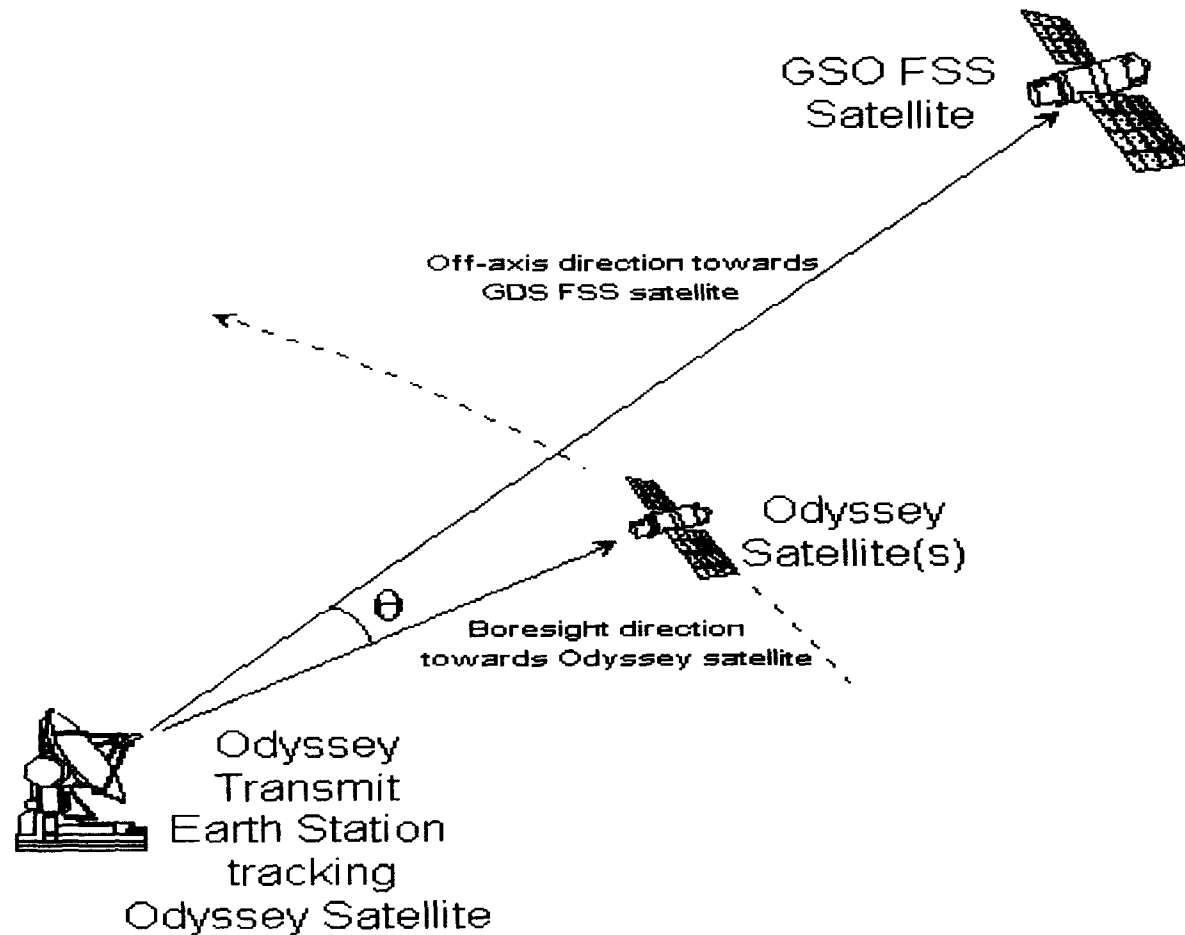

Assumptions (1)

- Worst case:
 - co-frequency (full frequency overlap)
 - co-polar (both operating in LHCP)
 - co-coverage (GSO receive beam peak at Odyssey earth station)
 - fully loaded Odyssey system (peak spectral density - CDMA)
- I_0/N_0 criteria:
 - CPM Report 95/118 (although not an ITU-R Rec.)
- Interferer as defined by TRW:
 - transmit power density (peak) = -55.49 dBW/Hz
 - transmit earth station gain (peak) = +64.8 dBi
 - off-axis gain envelope < 29-25 log(theta) dBi

Assumptions (2)

- GSO satellite receive characteristics:
 - peak antenna gain = 43.4 dBi (approximately 1° diameter)
 - system noise temperature = 600K (i.e., +27.8 dB-K)
 - gives $G/T = +15.6$ dB/K
- Above beam is compatible with the use of 65 cm user terminals
- Receive antenna beam peak pointing towards Odyssey uplink earth station location

Uplink Interference Geometry

In-Line Interference Analysis

Interfering power density into uplink antenna	-55.49 dBW/Hz
Peak gain of uplink antenna	+64.8 dBi
Peak interfering EIRP spectral density	+9.31 dBW/Hz
Space loss	-213.5 dB
GSO satellite peak gain	+43.4 dB
GSO received interfering power density (I_0)	-160.79 dBW/Hz
GSO satellite noise temperature	+27.8 dBK (600K)
Boltzmann's constant	-228.6 dB
GSO receive noise power density (N_0)	-200.8 dBW/Hz
GSO receive I_0/N_0	+40.01 dB

Interference Threshold Off-Axis Angle

CPM criteria (95/118)			Computed isolation requirements for interference threshold	
% time not to be exceeded	I_0/N_0 (linear)	I_0/N_0 (dB)	Off-axis isolation	Off-axis angle $29-25\log(\theta)$
0.87	0.06	-12.22	52.23 dB	4.54°
0.119	0.78	-1.08	41.09 dB	1.63°
0.0294	2.98	+4.74	35.27 dB	0.95°
0.0004	14.8	+11.70	28.31 dB	0.50°

Simulation Software

- Performs time-step simulation of the evolving orbits (NGSO-GSO and NGSO-NGSO)
- Define interference threshold beamwidth (cone angle) of the interfering earth station, and its earth location
- Adaptive algorithm allows long simulated time period with short run-time (365 days in ~2 minutes)
- Counts and aggregates interference events, including duration of each event.
- Provides graphical and numerical output
